

Illustrated Scenes from Rivers, Lakes, Ponds, Streams, and Bogs

On Earth, there are two aquatic environments, freshwater and marine. Rivers, lakes, ponds, streams, bogs and some marshes and swamps are freshwater biomes. This is where our drinking water comes from.

This exhibit is to bring awareness to what will be lost if human-driven threats are not curtailed. These threats include: wastewater, agrochemicals, plastics, and the impacts of climate change.

Participating artists chose to illustrate from the following categories: plants, fish, reptiles, mammals, insects, invertebrates/crustaceans and birds. The group of artists showing work in this exhibit are members of Three Rivers Botanical and Nature Artists.

Many works are for sale. If interested, please contact the artist via the email shown on the tag.
